**CSS Website Reflection**

The most useful selector for me was the class selector because I can use the same class on different parts of my website. For example, I can use one class to give different sections the same style instead of writing separate CSS rules for each one.

Margin and padding are different because margin adds space outside an element, while padding adds space inside the element, between the content and the border. I used both to make my website look more organized and easier to read.

The box model helped me understand how content, padding, borders, and margins work together. For example, adding padding inside a section gives the text more room, while the margin creates space between that section and other parts of the page.

One situation where a CSS rule can override another is when one selector is more specific. For example, main p is more specific than p, so it takes priority when both rules style the same property and no other rule has higher priority.

The change that improved my website the most was adding spacing and borders to the sections. It makes my Stardew Valley website look cleaner and helps the information feel less crowded.
